AMPAREX API

AMPAREX provides a programming interface (API) with which other applications can read, create, change and delete data from the AMPAREX database. Access to the AMPAREX API is subject to an additional monthly fee (please refer to AMPAREX API price list). The API must be activated first in order to work. The programming interface is implemented as a 'REST API' and only delivers data. The way the data gets utilised & processed would be the sole responsibility of the API user.

Possible use cases:

- create an App connected to the AMPAREX backend
- add articles and their availability into your webshop
- read, change and save data in the AMPAREX database
- access to the archived data such as images or documents

AMPAREX API is open for a collaboration with other software systems. The further development of the AMPAREX API is a strategic focus for the next few years.
